**Exercise 3**

Date: March 7, 2013

**Graph Theory Applications**

Spring 2013

---

**Problem 1.** Let  $P$  be a permutation matrix. Show that if  $A_1$  is the adjacency matrix of the graph, then  $A_2 = P^T A_1 P$  is an adjacency matrix corresponding to the same graph with the vertices renumbered.

**Problem 2.** In this exercise we will use some basic properties of rank of matrices. Given an  $n \times m$  matrix  $A$ ,  $\text{rank}(A) \leq \min\{n, m\}$ . Moreover,  $\text{rank}(AB) \leq \min\{\text{rank}(A), \text{rank}(B)\}$ , where  $A$  and  $B$  are matrices such that the number of columns of  $A$  equals the number of rows of  $B$ . All operations we consider are binary.

The  $n$  inhabitants of a town organize themselves into clubs subject to the following two conditions:

1. Each club must have an odd number of members.
2. Each pair of clubs must share an even number of members.

Show that no more than  $n$  clubs can be formed.

*Hint: consider the incidence matrix  $A$  where rows correspond to clubs and columns to inhabitants. What is  $AA^T$  equal to?*

**Problem 3.** The adjacency matrix of a directed graph  $D$  is the  $n \times n$  matrix  $A_D = (a_{u,v})$ , where  $a_{u,v}$  is the number of arcs with tail  $u$  and head  $v$ . Let  $A$  be the adjacency matrix of a tournament on  $n$  vertices. Show that  $\text{rank}(A)$  is either  $n$  or  $n - 1$ .

**Problem 4.** Let  $G$  be a regular graph with degree  $k$ . Show that  $k$  is an eigenvalue of the adjacency matrix  $A$  of the graph  $G$ .

**Problem 5.** Continuing with the above problem, show that for a  $k$ -regular connected graph  $G$ ,  $-k$  is also an eigenvalue of  $A$  if and only if  $G$  is bipartite.

**Problem 6.** Show that for any graph  $G$  with incidence matrix  $B$  and adjacency matrix  $A$ ,

$$BB^T = A + D,$$

where  $D$  denotes a matrix whose diagonal element  $(i; i)$  equals the degree of the vertex  $i$ , i.e.  $d_{i,i} = d(i)$ , while the off-diagonal elements  $d_{i,j}$  are zero.
