PROBLEM 1. Channels with memory have higher capacity. Consider a binary symmetric channel with $Y_i = X_i \oplus Z_i$, where \oplus is mod 2 addition, and $X_i, Y_i \in \{0, 1\}$.

Suppose that $\{Z_i\}$ has constant marginal probabilities $\Pr\{Z_i = 1\} = p = 1 - \Pr\{Z_i = 0\}$, but that Z_1, Z_2, \ldots, Z_n are not necessarily independent. Assume that (Z_1, \ldots, Z_n) is independent of the input (X_1, \ldots, X_n) . Let $C = \log 2 - H(p, 1 - p)$. Show that

$$\max_{p_{X_1,X_2,...,X_n}} I(X_1, X_2, ..., X_n; Y_1, Y_2, ..., Y_n) \ge nC.$$

PROBLEM 2. Consider two discrete memoryless channels. The input alphabet, output alphabet, transition probabities and capacity of the k'th channel is given by \mathcal{X}_k , \mathcal{Y}_k , p_k and C_k respectively (k = 1, 2). The channels operate independently. A communication system has access to both channels, that is, the effective channel between the transmitter and receiver has input alphabet $\mathcal{X}_1 \times \mathcal{X}_2$, output alphabet $\mathcal{Y}_1 \times \mathcal{Y}_2$ and transition probabilities $p_1(y_1|x_1)p_2(y_2|x_2)$. Find the capacity of this channel.

Problem 3. Show that a cascade of n identical binary symmetric channels,

$$X_0 \to \boxed{\mathrm{BSC} \ \#1} \to X_1 \to \cdots \to X_{n-1} \to \boxed{\mathrm{BSC} \ \#n} \to X_n$$

each with raw error probability p, is equivalent to a single BSC with error probability $\frac{1}{2}(1-(1-2p)^n)$ and hence that $\lim_{n\to\infty} I(X_0;X_n)=0$ if $p\neq 0,1$. Thus, if no processing is allowed at the intermediate terminals, the capacity of the cascade tends to zero.

PROBLEM 4. Consider a memoryless channel with transition probability matrix $P_{Y|X}(y|x)$, with $x \in \mathcal{X}$ and $y \in \mathcal{Y}$. For a distribution Q over \mathcal{X} , let I(Q) denote the mutual information between the input and the output of the channel when the input distribution is Q. Show that for any two distributions Q and Q' over \mathcal{X} ,

$$I(Q') \le \sum_{x \in \mathcal{X}} Q'(x) \sum_{y \in \mathcal{Y}} P_{Y|X}(y|x) \log \left(\frac{P_{Y|X}(y|x)}{\sum_{x' \in \mathcal{X}} P_{Y|X}(y|x')Q(x')} \right).$$
